Bangalore, India

PROFILE SUMMARY

Senior DevOps Engineer with 6+ years of experience building scalable cloud-native platforms and reliability systems across AWS and Azure. Experienced in combining Kubernetes, Infrastructure as Code, and AI-driven automation to solve complex operational challenges; from agentic production readiness frameworks and intelligent incident tooling to large-scale EKS upgrades and disaster recovery automation. Strong background in platform engineering, observability, and resiliency, with a focus on reducing operational overhead, improving system reliability, and enabling faster engineering velocity.

EDUCATION

University of Massachusetts
Masters in Computer Engineering

Boston, USA

Aug 2017 - May 2019

University of Mumbai
Bachelors in Electronics Engineering

Mumbai, India

Jul 2013 - May 2017

TECHNICAL SKILLS

Cloud & Platform Engineering: AWS, Azure, Kubernetes, Docker, Helm, Karpenter

Infrastructure Automation: Terraform, GitHub Actions, CI/CD Pipelines, Python, Bash

Observability & Reliability Engineering: Prometheus, Victoria Metrics, Grafana, Coralogix, OpenSearch, New Relic, Incident Management, SLO/SLA Design, On-call Engineering

AI-Driven Operations & Agentic Systems: LLMs, Claude Skills, Agentic Automation, Subagent Orchestration, Vector Databases, AIOps

Distributed Systems & Resiliency: Multi-AZ and Region Disaster Recovery, Production Readiness, Platform Scalability

WORK EXPERIENCE

Razorpay, Bangalore, India

Senior DevOps Engineer

Oct 2024 – Present

- Built an end-to-end **DevOps Agent** integrating a knowledge base and **MCP-based tool integrations** to autonomously handle operational and troubleshooting tasks, with built-in **evaluation metrics** to continuously track agent accuracy and effectiveness.
- Built an **Infra Reliability Orchestrator** (Razorpay Day 0 hackathon) that scores every service's reliability across **90 evidence-backed checks** spanning Kubernetes manifests, alerts, and **100+ historical incident RCAs**; auto-drafted **70+ remediation PRs** and added a **PR-time gate** that blocks changes removing existing safeguards, using the service's own incident history as context.
- Built and published **RCAgpt**, an AI-driven incident management tool leveraging **vector databases** and **LLMs** to auto-generate RCA drafts from incident signals, reducing response times and bringing consistency to post-mortems. [Published on Medium](#).
- Designed an org-wide **Go/No-Go production readiness framework** that replaced a days-long manual process with a **15-minute automated assessment**. Built as a fully agentic system using **Claude skills** — subagents evaluate service readiness across security, observability, reliability, and cell health — producing objective, consistent production scorecards at scale.
- Led an **org-wide Amazon EKS upgrade** across **150+ production clusters** with **zero downtime**, automating the end-to-end process using **Claude skills** — a version analyzer, node rotation, and cluster upgrade skill — turning a high-risk manual operation into a repeatable, auditable pipeline.
- Led **multi-AZ and regional DR strategy** for production EKS platforms, using **AI-assisted analysis** and automated observability workflows to validate failovers, detect configuration drift, and reduce manual operational overhead during DR drills.
- Architected **header-driven ingress routing policies** for tenant-segmented traffic across EKS, improving traffic governance, rollout safety, and operational flexibility for critical merchants.
- Redesigned alerting infrastructure using **Prometheus** and **Victoria Metrics** — reduced on-call noise by consolidating redundant alerts, setting dynamic thresholds, and streamlining escalation flows, significantly cutting alert fatigue and improving **MTTR**.

- Re-architected centralized logging with **Coralogix**, cutting application logging costs by nearly **60%** (\$14K) while improving log quality, query performance, and overall observability.
- Built an in-house **cronjob management platform**, migrating critical workloads off third-party tools with improved reliability, security, and operational visibility.
- Led org-wide migration to **Bottlerocket OS**, standardizing container hosts and improving security posture and patching reliability across the fleet.

Tresata, Bangalore, India

Senior DevOps Engineer

Oct 2022 – Oct 2024

- Led the transformation of an in-house product into a scalable **SaaS platform** using Kubernetes across **AWS (EKS)** and **Azure (AKS)**.
- Designed and implemented **secure multi-tenancy in Kubernetes**, enabling namespace isolation and controlled resource sharing across customers.
- Architected **auto-scaling strategies** using **Karpenter on AWS** and Azure native scaling, significantly improving resource efficiency and reducing costs.

DevOps Engineer

May 2021 – Oct 2022

- Built foundational Kubernetes infrastructure across **AWS (EKS)** and **Azure (AKS)** to support platform scalability.
- Developed **operational dashboards using New Relic**, improving system visibility and enabling proactive incident detection.
- Collaborated with engineering teams to onboard services onto Kubernetes, standardizing deployment and observability practices.

Rapid Micro Bio Systems, Lowell, USA

Software Quality Assurance Engineer

Jul 2020 – Apr 2021

- Migrated on-premise services into a secure **AWS VPC**, improving scalability and infrastructure reliability.
- Automated manufacturing workflows, reducing turnaround time by **40%** and improving operational efficiency using **Python**.

CERTIFICATIONS

- AWS Solution Architect
- Microsoft Azure Fundamentals
